

**ABSTRACT OF THE DISCLOSURE**

An electrical cable of the present invention comprises a plurality of spaced, parallel  
5 flat conductors. Each of the plurality of flat conductors was previously integral with each  
immediately adjacent flat conductor. A dielectric material is holds the conductors in the  
spaced, parallel relationship. The dielectric material can be a polymer film, a nonwoven,  
or other polymer materials such as PTFE, or expanded PTFE. The cable of the present  
invention is made by providing first and second webs of dielectric materials and a third  
10 sheet of conductive material. The first and second web materials are bonded to the third  
sheet of conductive material in a face-to-face layered relationship thereby forming a  
bonded laminate. The bonded laminate is then incrementally stretched to separate the  
sheet of conductive material in to spaced, parallel flat conductors.
